

# Antiplatelet agents and anticoagulants

The fragility of patients with vascular Ehlers-Danlos syndrome is not conducive to the prescription of antiplatelet and anticoagulant treatments.

### WHAT IS RECOMMENDED

---

- Discuss the prescription of antiplatelet agents / anticoagulants on a case-by-case basis.
- In all cases limit the prescription to the minimum duration necessary.
- Limit the prescription of NSAIDs and if they are necessary use only on an infrequent basis.

### WHAT YOU SHOULD NOT DO

---

- Continue antiplatelet / anticoagulant treatment over the long term, unless otherwise indicated.
- Combine anticoagulants with antiplatelets, and/or several antiplatelet agents.
